

Printing & Packaging Calculator Hub — Research + Execution Plan

Prepared for: Satyam Singh (PrishVik Technologies /
PGPL)

Date: 16 August 2026

Status: Research consolidated. Pre-build stage.

0. How This Document Started

The idea began from a live birth/death counter app.
That led to a broader question: which "build once, earn
later" web tools are actually worth building in 2026?
The research below traces that question from generic
tools down to a specific, defensible niche.

Conclusion up front: Generic calculators and
counters are dead ends. The printing/packaging
vertical — specifically an *India-localized* version of it —
is the only opening worth pursuing, and that window is
closing within 12–18 months.

1. Where The Idea Started — Live Counters

What they are

Population clocks / live birth-death counters. Main examples: Worldometer, worldbirthsanddeaths.com, LiveHumans, GlobalStats Live.

How they actually work

- No government or international body collects population data in real time.
- The counter is a **calculated projection**, not a tally.
- Base = UN estimates (census, birth/death registration, surveys). Fertility and mortality rates are applied and the number is incremented forward.
- A given country's underlying data averages ~2 years old.
- Global rates roughly: 4.4 births/sec, 1.9 deaths/sec
→ net ~2.5 people/sec, ~200,000+/day.

Technical build

Trivially simple: baseline number + timestamp + rate + `setInterval`. Fully client-side, no server needed.

Verdict — DO NOT BUILD

- Worldometer has been running since 2004 (Dadax Ltd), available in 31 languages, monetized via display advertising. Its domain authority is untouchable.
 - Novelty traffic only. Visitors stay ~30 seconds, view one page. Low pageviews/visit = low RPM.
 - Display ad RPM is typically \$0.50–\$5 per 1000 pageviews. Indian traffic sits at the very bottom of that range. 100,000 Indian pageviews ≈ ₹3,000–8,000/month.
 - Thin content creates AdSense approval problems.
-

2. Why Generic Calculator Sites Are Also Closed

The Indian finance calculator space is saturated

Existing players found in research, all covering the same EMI / GST / SIP / salary keywords:

fincalculator.in · indiacalculator.in · rupeescalc.com ·
netsalarycalculators.com · webtooltrix.com ·
hisabkaro.online · calcguru.in (built by a practising
CA) · mybharatportal.com · tool.enter2india.com

A new entrant cannot rank here. No differentiation available, high domain authority incumbents, and the

keywords are among the most competitive in Indian SEO.

But the *model* is proven — just not in this niche

Real, verified evidence that free tools drive massive organic traffic:

Site	Evidence
Omni Calculator	3,700+ single-purpose calculators, each targeting one specific "calculator" search. 23.1M monthly visitors (early 2024). Revenue model: Google AdSense only.
Ahrefs /writing-tools/	Launched from zero mid-2023. Peaked near 1,000,000 US organic visits/month. Still stable in the hundreds of thousands. Free tools only.
Gusto (payroll SaaS)	Free hourly paycheck calculator alone = ~17,800 US

Site	Evidence
	visits/month. Salary version = ~8,000 more.
Adobe	Free PDF-to-Word converter page = ~385,000 US visits/month. Pure top-of-funnel.
MortgageCalculator.org	12,000+ backlinks accumulated, including from the New York Times. Tools attract natural links — this is their biggest SEO advantage.

The winning keyword pattern

Omni Calculator's top organic keywords: *omni calculator*, *margin calculator*, *minecraft circle generator*, *discount calculator*, *calorie deficit calculator*.

The pattern is simply:

- [noun] + calculator
- [A] to [B] converter
- [noun] + generator

- [noun] + cost per [unit]

Nothing more sophisticated than that.

The warning

Ahrefs themselves noted this window will not stay open — as building tools becomes easier for everyone, the edge diminishes. **If this is going to be done, it has to be done now.**

3. Competitor Landscape — Printing & Packaging (Verified)

This is the core research. All findings below come from directly fetching or searching the live sites.

3.1 Panda Paper Roll — the closest model to copy

pandapaperroll.com/calculators

A Chinese thermal paper manufacturer (Shandong Ultra Paper Co., operating since 2000). **Not a calculator site — a B2B manufacturer** that built a free calculator toolkit as a lead funnel. This is exactly the structure recommended for PGPL.

Their complete tool list:

Basic Conversion

- Inches to Millimeters
- Millimeters to Inches

Paper Roll

- Paper GSM calculator
- Paper roll length calculator
- Paper roll diameter calculator
- Paper roll weight calculator
- Paper roll thickness calculator

Label Roll

- Label roll length calculator
- Label roll outer diameter calculator
- Number of labels calculator

Thermal Ribbon

- How many labels can a thermal transfer ribbon print?
- Thermal transfer ribbon length calculator
- Ribbon diameter calculator
- Ribbon weight calculator

Jumbo Roll

- Thermal jumbo roll price conversion
- Thermal jumbo roll weight calculation

- How many small rolls from one jumbo roll (yield)

Structural notes:

- Each tool gets its own clean URL:
/calculators/paper-gsm-calculator/
- Hub page positions them explicitly for "printing, packaging, and converting professionals"
- Copy emphasizes: no downloads, no spreadsheets
- CTA at bottom: "Can't find the calculators you need? Contact our expert team"
- Persistent WhatsApp button
- Tools link back into product category pages — traffic lands on tool, converts on product

Their weakness: Entirely export/Western oriented. No ₹, no GST, no Indian sheet sizes, no Indian machine specs, no Hindi.

3.2 PackagingTools.io — the most direct threat

Launched approximately **June 2026** (page dates: dieline generator 9 June, cost hub 13 June, break-even calculator 23 June). **Roughly 2 months old.** .io domain.

Full tool suite:

Cost & Pricing

- Packaging Cost Calculator
- MOQ Unit Cost Estimator
- Breakeven Quantity Calculator
- Packaging Cost Analyzer
- Packaging ROI Calculator
- Supplier Quote Comparison

Design & Print

- Dieline Generator
- Bleed & Safe Zone Guide
- Label Size Recommender
- CMYK / Pantone Converter
- Insert & Divider Calculator
- 3D Artwork Visualizer

Materials

- Material Waste Calculator
- Corrugated Strength (BCT)
- Sustainability Scorer

Their strategy — worth copying:

1. **Depth over breadth.** One industry, ~15 tools, all cross-linked. Every tool page links to sibling tools ("for full costing use the cost, break-even & ROI tools"). Builds topical authority.

2. **Tool + long-form content on the same page.**

Their break-even page includes the formula, a worked example, and practical advice (order larger volumes, use digital printing for short runs to avoid plate/setup charges, combine SKUs to share plates and dies). This is what prevents thin-content penalties.

3. **Real engineering, not toys.** Dieline generator uses actual geometry — cut, crease, bleed, safe-area, glue, board-thickness compensation. Exports SVG/PDF at 1:1 mm, plus DXF with layered CUT/FOLD/BLEED/SAFE/GLUE for die-makers. Sheet optimizer handles B1, B2, SRA3, SRA1.

4. **Monetization = leads, not ads.** "Send your dieline spec and we'll quote tooling, printing and production."

Traffic: Unknown and unmeasurable. Not present on Similarweb or Semrush public pages — meaning it is below their reporting threshold. This is **not a success story yet. It is an in-progress bet.**

3.3 **PackCalc.com — the most advanced**

Full connected workflow: product → carton → case → pallet. Tools include pallet pattern generation, box compression/strength, pallet load stability, ASTM D4169-23 test planner, Cpk capability analysis, GR&R studies, sampling plans, dew point, absolute humidity,

accelerated aging (Q10 math), FEFCO-style structure browser.

Requires account creation. Has free usage limits.

Already offering a paid Pro tier to enterprise packaging teams. This has crossed from tool-site into SaaS.

3.4 Other players

- **PackFlowCalc.com** — 25+ packaging machinery efficiency calculators (liquid filling speed, pick & place, heat sealing, vacuum sealing, cartoning speed, case packing, box forming, tray forming, stretch wrap, shrink wrap, flow wrap, bundling, OEE analysis).
- **PackagingCalculator.com** — Built by Sanford Fitelson, a packaging engineer who had been using spreadsheet formulas for years and decided to automate them. Covers unit conversions, density, corrugate calculations, pallet patterns, OTR and MVTR estimates. Monetized via advertising. **Note: this is the origin-story pattern most relevant to you — an insider automating their own repeated spreadsheet work.**
- **Printster.in** — Indian, but document/book printing rates (B2C), not converter math.
- **Afinia Label / Anytron** — ink cost calculators, but gated as vendor lead magnets (form submission

required, sales team follows up).

- **PrintVis** — Enterprise print MIS built on Microsoft Dynamics. Heavy, paid, different category entirely.

3.5 Dieline generators — SATURATED, DO NOT ENTER

At least seven established players on this single tool:

Site	Notes
Pacdora	The giant. See section 4.
DieCutTemplates.com	35,000+ vector templates, nesting tool, manufacturing cost calculator, 3D mockups. SVG/DXF/PDF.
PackMyMan.com	Parametric FEFCO/ECMA standards library, SVG/DXF/PDF, no login
Newprint.com	Free dieline generator, industry-standard output
BDPrint.com	Free, no account needed, PDF and AI formats

Site	Notes
CustomPackly.com	Generator feeds directly into a quote request
GroundedPackaging.co ("Genie")	30+ formats, PDF/SVG/DWG

4. Pacdora — Verified Traffic Data

This is the only competitor with reliable public numbers, and they matter.

August 2025:

- 1.63M total visits (Jun 1.11M → Jul 1.43M → Aug 1.63M, +14.12% MoM)
- Average session duration: 9:20
- Traffic sources: Direct 54.26%, google.com 18.09%

By country — India is their #1 market:

Country	Share	Visits
India	15.91%	258,780
United States	11.61%	188,860

Country	Share	Visits
Indonesia	6.95%	113,110
Brazil	5.94%	96,580
Mexico	3.34%	54,370

What this proves: There are already ~259,000 monthly Indian visits going to a foreign packaging tool site. Indian demand is real and large.

What this does NOT prove: Pacdora is a *design/mockup* platform, not a calculator. Those Indian users get dielines and 3D mockups. They do **not** get kraft BF costing, flute take-up factors, gear teeth math, or ₹ rates. That is the unserved portion.

5. The India Gap — Your Actual Moat

Not one competitor found addresses any of the following. This is the entire basis of the opportunity.

5.1 Unit measurement chaos

Indian factories cross multiple standards simultaneously:

- Paper/Kraft: GSM (g/m^2) but priced in ₹/kg and Metric Tonnes
- Flexo cylinders: 1/8" circular pitch, counted in gear teeth (Z)
- Machine deckle & web width: mm or inches, inconsistently
- Quoting: ₹ per sq inch, per sq metre, or per 1000 units

5.2 Corrugated costing — completely ignored globally

- Kraft BF (Burst Factor): 16 BF, 18 BF, 22 BF; virgin vs semi-kraft
- Flute take-up factors: A-Flute 1.54, B-Flute 1.35, C-Flute 1.45, E-Flute 1.27
- Stitching, gumming and conversion overhead, variable per kg

5.3 Label roll winding & slitting math

- Exact roll OD from label thickness + release liner caliper
- Cylinder repeat vs number of cavities across the web
- Slitting trim wastage optimization on jumbo label stock

5.4 Indian sheet sizes

Global tools offer B1, B2, SRA3, SRA1, A4, US Letter.
Indian printers work in **19×29, 20×30, 23×36, 25×36, 28×40 inches**. Nobody serves this.

5.5 No instant quoting for D2C brands

- Converters take 24–48 hours to return a basic quote
- No self-serve way to model custom box vs pouch across 500 / 2,000 / 10,000 units

5.6 Compliance — zero tools exist

FSSAI labelling, Legal Metrology packaged commodities declarations, MRP format, EPR plastic packaging registration, GS1 barcode registration. Rules change annually. Only PDFs and circulars exist — no interactive tool anywhere.

5.7 Language

No Hindi. "gsm kya hota hai", "label ka rate kaise nikale" — zero competition.

6. Core Formulas (Verify Before Coding)

These came from an uploaded report with no cited source. Validate every one against your

own production data at PGPL before shipping. A wrong formula in a costing tool destroys credibility permanently.

A. Paper roll length from outer diameter

$$\text{Length (m)} = [(D^2 - d^2) \times 0.785] / [\text{Thickness } (\mu\text{m}) / 1000]$$

D = outer roll diameter (mm), d = core outer diameter (mm), Thickness = substrate caliper (microns)

B. Flexo die repeat & gear teeth (1/8" CP standard)

$$\begin{aligned} \text{Cylinder Repeat (mm)} &= \text{Gear Teeth (Z)} \times 3.175 \\ \text{Number of Cavities} &= \text{Repeat (mm)} / (\text{Label Height} + \text{Gap mm}) \end{aligned}$$

Standard flexographic tooling runs on 1/8" circular pitch = 3.175 mm per tooth.

C. Corrugated 3-ply / 5-ply weight & cost

$$\text{Total Sheet Area (m}^2\text{)} = [(2L + 2W + \text{Joint}) \times (\text{H} + \text{Top/Bottom Flaps})] / 1,000,000$$

$$\begin{aligned} \text{Total Box Weight (g)} &= \text{Area (m}^2\text{)} \times [\text{GSM}_{\text{top}} + (\text{GSM}_{\text{flute}} \times \text{Flute_factor}) \\ &\quad + \text{GSM}_{\text{liner}} + \text{Gum_allowance}] \end{aligned}$$

Cost = apply respective ₹/kg kraft rate per layer + conversion cost per kg.

7. Target Audience

Two distinct groups. **Do not mix them** — different language, different intent, different monetization.

PRIMARY — Supply side
(converters/printers). Daily users.

Who	What they need	Frequency
Estimators / costing clerks	Everything. The hidden power user — sits in Excel all day calculating rates.	Daily
Label converters	Flexo repeat, gear teeth, roll OD, slitting yield	Daily
Corrugated box makers	3/5/7 ply weight, BF costing, BCT	Daily
Purchase managers	Kraft ₹/kg, GSM to reel weight	Weekly

Who	What they need	Frequency
Machine operators / planners	Ups per sheet, wastage, deckle utilization	Daily

→ These are your **paid widget** customers (₹999–2,999/month).

SECONDARY — Demand side (buyers). Infrequent, high lead value.

- D2C brand founders — "what will 500 boxes cost?" One visit, then wants a quote
- Packaging designers/agencies — dieline, bleed, safe zone
- Pharma/food QA & compliance teams — label declarations, MRP, FSSAI

→ These are **RFQ leads**, sellable at ₹200–500 each.

Geography — launch order

1. **Vasai / Bhiwandi** (home advantage — start here)
2. Daman / Silvassa
3. Ahmedabad / Rajkot
4. NCR (Noida / Faridabad)
5. Sivakasi, Ludhiana, Hyderabad

Two critical audience insights

1. They search in English, talk in Hindi. Tools and page titles stay English ("gsm calculator" is searched in English). WhatsApp support in Hindi. Hindi content for blog/explainers only.

2. This is a DESKTOP audience. The estimator works at an office computer. Build **desktop-first** — dense, table-heavy, multi-input forms. This is the opposite of standard modern advice. Do not waste time on a beautiful mobile-first landing page.

8. Keyword Strategy

Search volumes are **not** included below because verified data is not available (see Section 11). These are ranked by intent and competition, not volume. In B2B, intent matters more than volume.

Cluster 1 — Conversion / Unit tools (PRIORITY: HIGH)

Highest search frequency, easiest to rank, evergreen.

- gsm to kg calculator
- kg to meter conversion paper roll
- roll length calculator formula
- microns to gsm converter

- paper weight calculator gsm
- bopp film thickness to weight
- micron to gauge conversion film
- gsm calculator for paper sheet
- label roll length calculator
- roll diameter calculator

Cluster 2 — Printing cost / estimation

(PRIORITY: HIGH — best commercial intent)

- printing cost calculator india
- label printing cost per piece
- sticker printing rate calculator
- shrink sleeve cost calculator
- corrugated box cost calculator
- carton box rate calculation formula
- flexo printing cost per label
- die cost calculation printing
- paper cost calculator per sheet
- packaging cost per unit calculator

Cluster 3 — Layout / Planning (PRIORITY:

MEDIUM — lowest competition)

- ups calculator printing sheet
- how many labels per sheet calculator
- imposition calculator printing

- cutting layout optimizer paper
- sheet size optimization printing
- number of ups in 20x30 sheet
- die cut layout calculator

Cluster 4 — Compliance (PRIORITY: MEDIUM-HIGH — annual spikes, zero tools exist)

- fssai label requirements 2026
- legal metrology packaged commodities rules label
- mrp label declaration rules india
- epr registration plastic packaging
- barcode gs1 india registration cost
- food label declaration format india

Cluster 5 — Definition / Comparison (traffic feeders, AdSense eligibility)

- what is bopp label
- shrink sleeve vs wraparound label
- flexo vs offset vs digital printing
- self adhesive label material types
- what is gsm in paper explained
- hologram sticker vs security label

Cluster 6 — Local / Programmatic (PHASE 2 ONLY)

Pattern: [product] manufacturers in [city]

Cities: Vasai, Bhiwandi, Daman, Silvassa, Ahmedabad, Rajkot, Sivakasi, Noida, Ludhiana

Do not launch this early. Build authority first. Google does not penalize programmatic SEO per se — it penalizes thin, duplicate content. Template pages with unique data and genuine utility rank normally. Without authority first, 500 pages will be flagged.

Build order

1. Cluster 1 — traffic base
2. Cluster 3 — fastest wins, lowest competition
3. Cluster 2 — money pages
4. Cluster 5 — glue content, internal linking
5. Cluster 4 — compliance
6. Cluster 6 — programmatic

9. Product Roadmap

Phase 1 — Free Public Utility Hub (traffic magnet)

Label Master

- Teeth-to-Repeat calculator
- Roll OD calculator
- Slitting yield optimizer
- Ribbon consumption calculator

Corrugation Master

- 3/5/7-Ply weight calculator
- Bursting strength calculator
- BCT calculator

Paper & Film

- GSM to reel weight
- Thickness (μm) to yield (m^2/kg)

Commercial Print

- Sheet ups optimizer — **19×29", 20×30", 23×36", 25×36", 28×40"**

Seed asset: Your existing Label Rate Calculator (already built in HTML/CSS/JS). Publish that first with Indian units. Everything else extends from it.

Phase 2 — Pro & Enterprise

- D2C Packaging Budget Estimator (unit cost across order volumes)
- Traceability & Security Spec Builder (barcode size, QR payload, security label planner) — **direct fit**

with PGPL's existing business

- Instant PDF Specification Sheet — branded technical data sheets, 1-click download
-

10. Monetization

Ranked by realistic return.

1. Embeddable B2B widget (Micro-SaaS) — STRONGEST IDEA

~90% of Indian label and box converters have static websites with no quoting tool. Offer a white-label JavaScript embed so they can put your calculator on their own site with their own margins and markup logic.

Price: ₹999 – ₹2,999/month per printer.

Why this is best: it makes you their supplier, not their competitor.

2. Verified manufacturer lead generation

CTA on spec-calculation pages: "Request Quotations from Verified Manufacturers in Maharashtra / Gujarat / NCR". Sell qualified RFQs at ₹200–500 per lead, or a lead-pass subscription at ~₹4,999/month.

3. Raw material index & vendor sponsorship

Live kraft paper price trends (₹/kg by BF), substrate directories (Avery Dennison, Ritrama, Cosmo Films

distributors). Sponsored banners, featured supplier badges.

4. Display advertising — LOWEST PRIORITY

Realistically ₹2,000–3,000/month at expected traffic levels. Not the point. Do not optimize for this.

Revenue math

- 3,000–8,000 monthly visitors is the realistic ceiling — **not** 100,000
- But: 10 paid widget subscribers = ₹10,000–30,000/month recurring
- Plus RFQ leads
- Plus PGPL's own inbound
- **One shrink sleeve order is ₹2–3 lakh. A single closed deal justifies the entire year's effort.**
- Organic search leads close at 14.6%; outbound closes at 1.7%
- B2B manufacturers typically see organic lead growth in 4–6 months, positive ROI in 6–9 months
- Niche industrial keywords rank faster and cheaper than consumer categories

11. Data Integrity Notes — READ BEFORE ACTING

The uploaded PDF report: what to keep, what to discard

KEEP — Sections 3, 4, 5, 6 (the domain knowledge):

Kraft BF, flute take-up factors, gear teeth math, roll length formula, corrugated weight formula, Indian sheet sizes, monetization model. This is genuine, valuable, and forms the moat.

DISCARD — Section 2 (the traffic table). It is not reliable.

Specific problems found:

1. **No source citations anywhere.** No Similarweb, no Ahrefs, no date. Precise-looking figures like "India Share ~12%" do not exist without a source.
2. **Pacdora numbers are wrong.** Report says "1,200,000+ / ~28% India". Verified actual: 1.63M visits, 15.91% India. Volume understated, India share nearly doubled.
3. **PackagingTools.io is listed at 8,000–18,000 monthly traffic.** That site's pages were published in June 2026 — it is ~2 months old. A new .io domain cannot reach that in 2 months. This number is fabricated.
4. **Factual merge error.** The report groups `potatoinsights.com` / `packagingcalculator.com` as "Flexible & Pouch

Costing". PackagingCalculator.com is Sanford Fitelson's packaging-engineer tool covering unit conversions, density, corrugate calculations, pallet patterns, OTR/MVTR. It has nothing to do with pouches. Two unrelated sites merged under a wrong label.

Conclusion: Those numbers appear AI-generated. Do not base any business decision on them.

How to get real data

- **Semrush MCP** — connected, but **API units are exhausted**. Options at <https://www.semrush.com/mcp-access>
- **Google Search Console** — free and *more accurate* than any third-party tool, because it is your own data. Export CSV and analyze which head terms appear with 30+ modifiers (the programmatic SEO signal), and where impressions exist without clicks.
- **Google autocomplete + People Also Ask** — real queries, free
- **Keyword Surfer / Ubersuggest free tier** — rough ranges
- **IndiaMART search filters** — the GSM/roll length/micron filters there reveal the actual buyer vocabulary

- **DataForSEO / SerpApi API** — cheaper than a Semrush subscription for bulk volume pulls
-

12. Complete Site Reference List

Live counters

1. worldometers.info
2. worldbirthsanddeaths.com
3. [LiveHumans](https://livehumans.com)
4. [GlobalStats Live](https://globalstats.live)

General calculator hubs (global)

5. omnicalculator.com
6. calculatorsoup.com
7. mortgagecalculator.org
8. tdeecalculator.net
9. calculatorzilo.com

India finance calculators (saturated — avoid)

10. fincalculator.in
11. indiacalculator.in
12. rupeescalc.com
13. netsalarycalculators.com
14. webtooltrix.com
15. hisabkaro.online
16. calcguru.in
17. mybharatportal.com
18. tool.enter2india.com

Printing / paper — MOST RELEVANT

- 19. **pandapaperroll.com/calculators** ← primary model to study
- 20. printster.in/pricecalculator
- 21. afinialabel.com
- 22. anytron.com

Packaging tool suites — DIRECT COMPETITORS

- 23. **packagingtools.io** ← 2 months old, active threat
- 24. **packcalc.com** ← most advanced, already SaaS
- 25. packflowcalc.com
- 26. packagingcalculator.com
- 27. potatoinsights.com
- 28. packagingsquad.com

Dieline generators — SATURATED, DO NOT ENTER

- 29. pacdora.com
- 30. diecuttemplates.com
- 31. packmyman.com
- 32. newprint.com
- 33. bdprint.com
- 34. custompackly.com
- 35. groundedpackaging.co

Print ERP/MIS (different category)

- 36. PrintVis
-

13. Immediate Next Steps

Before writing any code:

1. **Validate the formulas.** Take Section 6 and check every formula against PGPL's actual production data. Non-negotiable.
2. **Validate demand with humans, not Google.**
Show a beta to 10–15 converter contacts you already have through PGPL. If they use it daily, you have product-market fit. If they don't, no amount of SEO traffic will matter.
3. **Publish the Label Rate Calculator you already have.** Add ₹, GST, Indian sheet sizes. Ship one tool, not fifteen.
4. **Reverse-engineer one Panda Paper Roll tool page** — exact word count, H2 order, FAQ schema, internal link structure. Use it as the template for every page.
5. **Set up Google Search Console from day one.** It becomes your keyword research tool for free.

Strategic reminder: Do not chase traffic. Chase buyers. 500 printing business owners who know you are worth more than 500,000 random visitors.

Timing: The window closes as tool-building gets easier. 12–18 months at most.
